Coco CLI

HACKATHON

GCC Edition

Team Name : Aegis

Team Leader Name : Anshuman Pandey

Team Size : 1 (confirm registered team size)

Problem Statement : Risk, Fraud & Regulatory Intelligence Copilot

Problem brief

- Users: banking and NBFC fraud investigators and risk analysts.
- Pain: transaction anomalies, account context and policy clauses are reviewed in separate tools.
-
- Aegis brings signal, evidence and a finding draft into one governed workflow. Circular transfers, shared devices and payment velocity link to source transactions and policy references.
- Credit expected loss and liquidity stress scenarios show their assumptions. All demo data is synthetic. Human review remains required.

Architecture and modular capabilities

Read-only RSA-authenticated SQL API • secrets stay on the server

CoCo CLI skills: none successfully executed. The standard trial rejects CoCo CLI access. Cortex COMPLETE also refuses this trial. Optional Cortex integration is implemented but disabled.

Impact statement and validation

Verified prototype outcomes

- Snowflake and app scores agree on all 5 seeded review accounts.
- 257 payments connect to transaction and policy evidence.
- 20% outflow stress gives 83.3% LCR and INR 30 lakh shortfall.
- Exported drafts include source query IDs and a SHA-256 digest.

Scaling beyond this demo

Use governed production ingestion, calibrated thresholds, evaluation labels and persistent analyst audit trails. No measured time-saving or predictive accuracy improvement is claimed.

Open app → Investigate ACC-001 → Export finding
Ask: “LCR under 20% outflow stress” → Inspect POL-06
Adjust PD and liquidity assumptions in Portfolio risk.

Evidence and reproducibility

Live Snowflake SQL is verified. Source, SQL, synthetic data license and deck are public.
Scores are monitoring severity, not fraud probability.

Mandatory CoCo CLI demo video is blocked by account eligibility; no successful CoCo use is claimed.
